

POWER PEOPLE

Talent Acquisition for a **Greener Future**

Bioenergy

Traditional bioenergy use refers to the combustion of biomass in such forms as wood, animal waste and traditional charcoal. Modern bioenergy technologies include liquid biofuels produced from bagasse and other plants; bio-refineries; biogas produced through anaerobic digestion of residues; wood pellet heating systems; and other technologies.

Power People understands the challenges facing the sector no matter what technologies you have used. Our dedicated team of consultants can support clients throughout the whole project lifecycle and the entire supply chain for biodiesel, ethanol, biomass, and other biofuels.

These include:

Engineering, chemical application, planning, logistic, procurement, development, operations and maintenance, project controls, and project management.
